Avg Salary by Tenure

salary tracks job title & performance, not seniority

Attrition by Remote-Work %

flat — remote policy has no attrition signal

Attrition vs Satisfaction & Performance

no gradient in either dimension

Job Titles in Scope

headcount by title

Key Findings

Pay equity is healthy. Women earn on average **\$4.50 more** than men company-wide; within every job title the gap stays under **±\$25** (0.4% of pay). No corrective action needed — keep monitoring.

Departments are remarkably uniform. Headcount (10,956–11,216), avg salary (\$6,378–\$6,417), performance (2.98–3.02) and attrition (9.6%–10.5%) barely differ across all 9 departments.

Salary is almost fully explained. A linear model of job title + performance + demographics reaches **$R^2 = 0.99$** (MAE ≈ \$95). Engineers/Managers earn ≈ **+\$2,600** and each performance point adds ≈ **+\$493/month**. Department, education and gender add ~nothing.

Data looks synthetic. Independent feature generation, uniform segments and a near-perfect salary formula are hallmarks of simulated data. Treat conclusions as a demonstration of the analysis pipeline, not as organizational truth.

Attrition is statistically unpredictable here. Both models land at **AUC ≈ 0.49** (coin-flip). Every segment — satisfaction, performance, tenure, remote work, overtime — sits within **9.5%–10.3%** of the 10.0% company rate. Leavers cannot be identified from this data; investigate data quality & exit-interview capture.

Engagement levers show no signal. Training hours, overtime, sick days, team size and remote frequency show $|r| < 0.01$ against performance and satisfaction. Before investing more in these levers, verify how performance is measured.
